QuietDeal: Privacy-Preserving Negotiation Agents for USDT on Bitcoin

Project proposal · *Agentic Dollars on Bitcoin* hackathon · BLOX, Turin · 17–18 October 2026 · Mohammad Eghbal Kordi

OVERVIEW

QuietDeal is a pair of AI agents that negotiate a price for their owners and settle the deal in USDT on Bitcoin. The model runs on the user's device, so the user's private limit never leaves it. The project uses both required tools, QVAC and RGB, plus WDK for the wallet layer.

PROBLEM

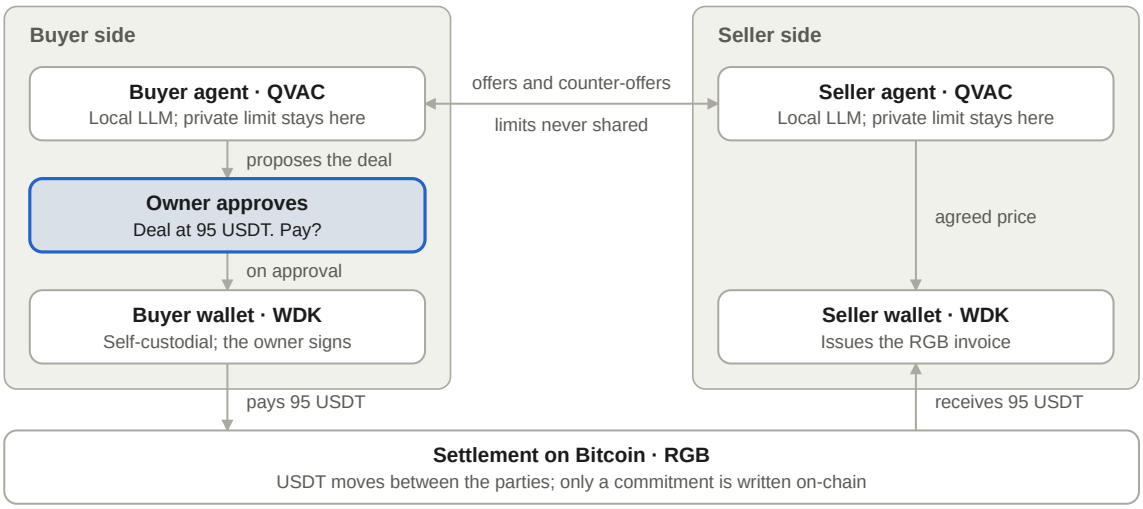

AI agents are starting to buy and sell for people, but a cloud-hosted agent sends its owner's reservation price (the most a buyer will pay, or the least a seller will accept) to a third-party server. Once that number leaks, the other side can capture the whole surplus. Agents also need a stable currency, low fees and the user's final approval.

SOLUTION

A buyer agent and a seller agent exchange offers in rounds until they agree or walk away. Each agent sees only its own owner's limit. When they agree, the user gets one question, such as "Deal at 95 USDT. Pay?", and approves or rejects it. On approval, the agreed amount is paid in USDT on Bitcoin.

Tool	Role in QuietDeal	Status
QVAC	The agent's brain: a local LLM (llama.cpp, GGUF) that runs the negotiation on a laptop or phone, with no internet or API key	Required
RGB	Settlement: the seller creates an RGB invoice and the buyer pays USDT; only a commitment goes on-chain	Required
WDK	Self-custodial wallets for buyer and seller; the agent proposes a payment and the user signs	Optional (bonus)

Private limits stay on each device; only offers and the payment leave it

ROADMAP

We prepare each tool before the event, so the 30 hours on site go to building the agents.

Prepare
1 to 16 October

- QVAC: small LLM on device
- RGB: issue and send USDT
- 13 Oct: mentor session
- WDK, setup and team roles

Build
17 Oct, 9:00 · about 30 hours

- Negotiation protocol
- Buyer and seller agents
- RGB invoice and payment
- WDK wallet integration

Present
18 October

- 15:00 project submission
- 16:00 pitch and judging
- Open-source repository

DELIVERABLES

- A working demo: two agents negotiate on-device and close one deal end to end
- A real USDT transfer on RGB, paid from a WDK wallet after the user approves
- An open-source repository with setup steps and a short architecture note
- A 5-minute presentation for the judging session

TEAM AND REQUESTS

The team lead is a PhD candidate in multi-agent negotiation and an MSc student in Data Science and Engineering.

Before the event, we would value mentor guidance on RGB testnet USDT and on the submission format.
